CECT CHEST

SPIRAL SCANNING OF THORAX WAS DONE FROM BASE OF NECK TO THE DOMES OF DIAPHRAGM AFTER ADMINISTRATION OF NONIONIC IV CONTRAST. FEW PLAIN SCANS WERE ALSO OBTAINED.

Clinical History: Left breast carcinoma (recent FNAC)

FINDINGS:

Left breast: A large heterogeneously enhancing soft tissue density lesion is seen in the outer upper aspect of the breast parenchyma. It measures ~ 45 x 38 mm. It is lying close to the pectoralis major muscle. Mild streakiness is seen in the fat surrounding the lesion in the breast parenchyma. A soft tissue density lesion measuring ~ 15 x 11 mm is seen in the left anterior chest wall subcutaneous fat at the level of anterior end of the left 4th rib. Multiple heterogeneously enhancing & enlarged lymphnodes are seen in the left axilla. The lymphnodes measure upto 25 x 18 mm. A small soft tissue density lesion measuring 9 x 7 mm is seen in the left infra-axillary fat - ? Lymphnode.

Few fibro calcific lesions with costal pleural thickening seen in the apical segment of the right upper lobe. The lesions measure 3- 8 mm.

Rest of lungs are normal in architecture and attenuation.

Trachea, major bronchial divisions and mediastinal great vessels appear unremarkable.

No evidence of significant mediastinal/hilar lymphadenopathy is seen.

No evidence of any pleural effusion/ thickening is seen on either side.

Cardiac size is normal with apparently normal configuration. No obvious pericardial collection seen.

Rest of chest wall structures appear unremarkable.

IMPRESSION: CECT CHEST REVEALS:

Left breast: A large heterogeneously enhancing soft tissue density lesion in the outer upper aspect of the breast parenchyma. It measures ~ 45 x 38 mm. It is lying close to the pectoralis major muscle. Mild streakiness is seen in the fat surrounding the lesion in the breast parenchyma - It represents known carcinoma

A soft tissue density lesion measuring ~ 15 x 11 mm in the left anterior chest wall subcutaneous fat at the level of anterior end of the left 4th rib - It may represent satellite lesion

Multiple heterogeneously enhancing & enlarged lymphnodes in the left axilla. The lymphnodes measure upto 25 x 18 mm - Metastatic lymphnodes

A small soft tissue density lesion measuring 9 x 7 mm in the left infra-axillary fat - ? Lymphnode

Few fibro calcific lesions with costal pleural thickening seen in the apical segment of the right upper lobe. The lesions measure 3- 8 mm - These nodules may represent chronic infiltrates

PLEASE CORRELATE CLINICALLY.
